

# SAMARTH CHANDRA

Software Engineer . Java . Backend & Distributed Systems . AI .

☎ 9608621700 ✉ samarth.chandra07@gmail.com 🐙 GitHub 🔗 LinkedIn 🌐 Website 📍 New Delhi, India

## EDUCATION

**NIET** | Greater Noida

2024 - 2028

B.Tech CSE

CGPA : 8.92

## PROJECTS & EXPERIENCE

### Automated build & Deployment pipeline | 🐙 Github

- Engineered a cloud-native deployment pipeline that automates repository cloning, containerized builds, artifact generation, and application hosting, reducing deployment setup time from 15–30 minutes to under 2 minutes.
- Architected an event-driven log streaming infrastructure that delivers real-time build observability with sub-second (<500 ms) latency, enabling concurrent deployment monitoring.
- Built a subdomain-based deployment orchestration layer that automatically provisions unique subdomains and routes applications through PostgreSQL-backend subdomain resolution and routing logic.

**Technologies / Tools Used :** Node.js, AWS, Docker, PostgreSQL, Kafka

### Multimodal Video-ads Compliance auditor | 🐙 Github

- Architected a multimodal compliance auditing pipeline that evaluates video-ads against FTC advertising guidelines, analyzing speech, visuals and on-screen text, generating structured Pass/Fail reports with supporting evidence.
- Engineered an agentic RAG workflow for multi-step policy validation and integrated end-to-end tracing, telemetry, and latency monitoring for AI workflow observability.

**Technologies / Tools Used :** Python, RAG, LangGraph, Azure, FastAPI

### Video transcoding pipeline | 🐙 Github

- Built a media processing pipeline that converts uploaded videos into multiple streaming-ready resolutions through asynchronous job queues and background workers.
- Designed an event-driven transcoding workflow with isolated containerized workers, enabling reliable video processing and artifact storage from ingestion to delivery.

**Technologies / Tools Used :** Node.js, Docker, AWS, FFmpeg

### Offline UPI Payment System | 🐙 Github

- Developed an offline-first UPI payment system that enables secure peer-to-peer transactions by propagating encrypted payment packets across a mesh network until an internet-connected bridge node becomes available.
- Implemented hybrid encryption and idempotent transaction settlement to ensure secure communication, prevent duplicate processing, and maintain transaction integrity.

**Technologies / Tools Used :** Spring Boot, Spring Data JPA, Hybrid encryption

## SKILLS

|                                   |                                                                   |
|-----------------------------------|-------------------------------------------------------------------|
| <b>Languages :</b>                | Java, C++, Python, JavaScript, TypeScript                         |
| <b>Backend &amp; Frameworks :</b> | Spring Boot, Node.js, FastAPI, WebSockets, REST APIs              |
| <b>AI Engineering :</b>           | LLMs, Agentic AI, RAG, NLP, MCP, OpenAI/Claude SDKs               |
| <b>Data, Cloud &amp; Infra :</b>  | PostgreSQL, Redis, Kafka, Docker, AWS(S3 SQS ECR ECS), Kubernetes |
| <b>Development Practices :</b>    | Agile, Git, CI/CD                                                 |

## CODING PROFILE

Worked through 350+ questions spanning over DSA and System Design, across multiple platforms.

[Leetcode: wake\\_up\\_sam](#)

[GFG: wakeupsam](#)
